

Reference Completeness Report

Canonical references: 267.

Completeness is field-dependent and publication-type dependent. Identifier absence is not automatically an error: older books, reports, and standards may legitimately lack DOIs. The accompanying audit distinguishes not-applicable candidates from unresolved values only where the source type makes that determination possible.

Current identifier coverage is limited: 14 DOI-bearing records and 4 ISBN-bearing records. Volume, issue, and page coverage remain uneven. The bibliography is structurally complete but authority metadata is incomplete.
