

Measurement Handbook

Governing rule

A metric is not a construct.

Measurement contract

For every measurement declare: construct, measurand, unit, level of analysis, observation model, instrument, operationalization, coding, estimator, scale type, permissible transformations, uncertainty, reliability, validity evidence, comparison population, task, projection, context, and prohibited interpretations.

Evidence levels

Raw record.

Verified observation.

Coded observation.

Derived measure.

Model-based estimate.

Construct evidence.

Mechanism evidence.

Generalized claim.

Canonical metric families

Timing; frequency; sequence; path; accuracy; completion; discovery; belief calibration; opportunity mismatch; recovery; reversibility; strategy diversity; transfer; prediction calibration; accessibility; measurement quality.

Quality checks

Instrument calibration; inter-rater reliability; test-retest reliability; construct validity; convergent/discriminant evidence; measurement invariance; sensitivity analysis; missingness analysis; uncertainty budget; preregistered equivalence bounds.
