

Publication Readiness Assessment

Determination: publication infrastructure is suitable for internal Version 1.0 use, subject to bibliographic and evidential verification before external scholarly publication.

The package provides the requested infrastructure without modifying theory. It is sufficient for controlled authoring, study design, replication planning, data structuring, and reference maintenance. It is not a claim that all 600 bibliographic records have been authority-validated or that all canonical constructs have empirical validation.

Blocking items for external release

Authority validation of references most central to canonical claims.

Human review of duplicate groups and candidate DOI/ISBN metadata.

Ratification of concept-source mappings and evidence confidence.

Figure licensing, captions, editable sources, and accessibility text.

Pilot validation of schemas and templates.
